VENT BRUSH HAVING FLEXIBLE BRISTLE SUPPORT

Abstract of the Disclosure

A hairbrush includes a body and a panel having bristle mounts and support legs. Each of the bristle mounts is secured to at least three of the support legs in a network arrangement that defines openings for passage of an airstream through the panel. The hairbrush includes bristles located at a first set of bristle mounts. The hairbrush may also support clusters of bristles in recesses defined in hubs located at a second set of bristle mounts. The hairbrush may include a head portion defining a central opening across which the panel extends. Alternatively, the panel may be secured to the body in a substantially cylindrical configuration.
